Introduction to HTML

Mr. Appana Kesava, MCA
Lecturer in Computer Science
Sri Surya Jr. & Degree College
Narsapur.

1

Definitions

- WWW – World Wide Web.
- HTML – HyperText Markup Language – The Language of Web Pages on the World Wide Web.
- HTML is a text formatting language.
- URL – Uniform Resource Locator.
- Browser – A software program which is used to show web pages.

2

- “Normal text” surrounded by bracketed *tags* that tell browsers how to display web pages
- Pages end with “.htm” or “.html”
- HTML Editor – A word processor that has been specialized to make the writing of HTML documents more effortless.

3

Tags

- Codes enclosed in brackets
- Usually paired
`<TITLE>My Web Page</TITLE>`
- **Not** case sensitive
`<TITLE> = <title> = <TITLE>`

Choosing Text Editor

- There are many different programs that you can use to create web documents.
- HTML Editors enable users to create documents quickly and easily by pushing a few buttons. Instead of entering all of the HTML codes by hand.
- These programs will generate the HTML Source Code for you.

5

Choosing Text Editor

- HTML Editors are excellent tools for experienced web developers; however, it is important that you learn and understand the HTML language so that you can edit code and fix "bugs" in your pages.
- For this Course, we will focus on using the standard Microsoft Windows text editors, Notepad. We may use also textpad.

6

Starting Notepad

- NotePad is the standard text editor that comes with the microsoft windows operating system. To start Notepad in windows 9x or XP follow the steps below:
- Click on the "Start" button located on your Windows task bar.
 - Click on "Programs" and then click on the directory menu labeled "Accessories".
 - Locate the shortcut "Notepad" and click the shortcut once.

HTML Page Creation & Editing

In this chapter you will learn to create HTML pages with a standard text editor.

Objectives

Upon completing this section, you should be able to

1. Choose a Text Editor.
2. Create a Basic Starting Document.
3. Understand and set Document Properties.
4. View Your Results in a Browser.

Creating a Basic Starting Document

```
<HTML>
<HEAD>
  <TITLE>Al al-Bayt University</TITLE>
</HEAD>
<BODY>
  This is what is displayed.
</BODY>
</HTML>
```

Creating a Basic Starting Document

- The HEAD of your document point to above window part. The TITLE of your document appears in the very top line of the user's browser. If the user chooses to "Bookmark" your page or save as a "Favorite", it is the TITLE that is added to the list.
- The text in your TITLE should be as descriptive as possible because this is what many search engines, on the internet, use for indexing your site.

Setting Document Properties

- Document properties are controlled by attributes of the BODY element. For example, there are color settings for the background color of the page, the document's text and different states of links.

Color Codes

- Colors are set using "RGB" color codes, which are, represented as hexadecimal values. Each 2-digit section of the code represents the amount, in sequence, of red, green or blue that forms the color. For example, a RGB value with 00 as the first two digits has no red in the color.
